Introduction to Python

Lecture No.- 02

By-Satyendra Chaudhary Sir

Topics to be Covered

Topic

Abstract classes

Access modifiers

If a class contains one or more abstract methods, then that class is called abstract.

⇒ Object of abstract class cannot be created.

⇒ module used to create abstract class is abc.

⇒ @abstractmethod → abstract method

from abc import ABC.

class Car(ABC):

def Structure(self):
 print("Car has 4 wheels")

@abstract method.

def speed(self):
 pass

→
[obj1.Structure()
obj1.speed()
obj2.speed()]

car has 4 wheels.

car speed is 250 km/h

car speed is 100 km/h.

class Bmw(Car):

def speed(self):
 print("Car speed 250 km/h")

class Alto(Car):

def speed(self):
 print("Car speed is 100 km/h")

obj1 = Bmw()

obj2 = Alto()

from abc import ABC

```
class PaymentMethod(ABC)
```

```
    @abstractmethod
```

```
    def payment_process(self):  
        pass
```

```
class CreditCard(PaymentMethod):
```

```
    def __init__(self, creditcardno, Expirydate):
```

```
        self.No = creditcardno
```

```
        self.date = Expirydate
```

```
    def payment_process(self):
```

```
        print("Payment is processing through {self.No}")
```

```
class UPIPayment(PaymentMethod)
```

```
    def payment_process(self):  
        print("Payment is completed by  
        UPI")
```

```
UPI_1 = UPIPayment()
```

```
UPI_1.payment_process
```

Access modifiers → variables, methods

Java ✓
Python ✗

private. ⇒ variable or method can be accessed in class only.

public. ⇒ availability everywhere.

protected ⇒ variable or method " " " " in class and its child class.

default → can accessed in same package.
