Lecture No -03

By-Satyendra Chaudhary Sir

Topics to be Covered

Topic

11hr

Process. Control Block -(PCB)

CPU Scheduling

Process no.
Program counter
Data registers
...

Idle

Process Life Cycle.

There are n process.

What can be the maximum and minimum, no of process in.

	<u>Min</u>	<u>Max.</u>
Ready State.	0	$(n-1)$
<u>Blocked/Waiting</u>	0	n
Running	0	1

3 Queues →

Job Queue. →

all PCB ^{created.} are stored in Job Queue.

Main Memory.

Ready Queue →

Process is waiting for Processor

Device Queue → I/O device Queue.

Schedulers

Migrate. PCB Process from. one queue to another queue.

Hard disk

Main memory

→ long term Scheduler → Job queue → Ready Queue.

* which scheduler is responsible for multiprogramming.

→ Long term Scheduler

→ Short term Scheduler → Ready → Running. ∴
it allocates CPU to Process.

CPU scheduler

Midterm Scheduler $\Rightarrow$

Sometimes removal of process is required from.
^{Ready}
(~~Job~~ queue) ^{Job Queue.}
main memory to Secondary memory

$\Rightarrow$ Ready Queue $\rightarrow$ Job Queue.

decrease. degree of multiprogramming

Dispatcher - 3

* At the time switching context: CPU is idle
